Advanced Java Programming Course

By Võ Văn Hải Faculty of Information Technologies Industrial University of Ho Chi Minh City

Application Coject Incode Interacts With JPA Or Hibernate OGM JPA Or Hibernate OGM JPA Or Hibernate OGM Geologistic JP-QL parser Geologistic JP-QL parser JR-QL pa

Session objectives

- Hibernate OGM
 - Architecture
 - Query
- . Mapping core
- Associations

Based on: Hibernate OGM 5.1.0. Final Reference Guide

6

Configure and start Hibernate OGM

Using JPA

```
1 <?xml version="1.0" encoding="utf-8"?>
   30<persistence xmlns="http://java.sun.com/xml/ns/persistence"
        xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemalocation="http://java.sun.com/xml/ns/persistence
        http://java.sun.com/xml/ns/persistence/persistence_2_0.xsd"
version="2.0">
        <persistence-unit name="ogm-jpa" transaction-type="RESOURCE_LOCAL">
             org.hibernate.ogm.jpa.HibernateOgmPersistence
             <class>entities.Lophoc</class>
             <class>entities.Sinhvien</class>
             <class>entities.Monhoc</class>
             properties>
                 property name="hibernate.ogm.datastore.provider"
                 value="org.hibernate.ogm.datastore.mongodb.impl.MongoDBDatastoreProvider" />
cproperty name="hibernate.ogm.datastore.database" value="demodb" />
                 property name="hibernate.ogm.datastore.create_database"
                     value="true" />
             </properties>
22 </persistence-unit>
```

persistence.xml file

Configure and start Hibernate OGM

Using Hibernate ORM native APIs

```
// create the StandardServiceRegistry
StandardServiceRegistry registry = new StandardServiceRegistryBuilder()
         .applySetting(OgmProperties.ENABLED, true)
         // assuming you are using JDBCTransactionFactory
         .applySetting(AvailableSettings.TRANSACTION_COORDINATOR_STRATEGY,
                      "org.hibernate.transaction.JDBCTransactionFactory")
         // configure current session context
         .applySetting(AvailableSettings.CURRENT_SESSION_CONTEXT_CLASS, "thread")
         // assuming MongoDB as the backend
         .applySetting(OgmProperties.DATASTORE_PROVIDER, MongoDB.DATASTORE_PROVIDER_NAME)
         .applySetting(OgmProperties.DATABASE, "demodb")
.applySetting(OgmProperties.CREATE_DATABASE, "true")
         .applySetting(OgmProperties.HOST, "127.0.0.1:27017")
OgmSessionFactory ogmSessionFactory= new MetadataSources(registry) .addAnnotatedClass(Sinhvien.class)
         .addAnnotatedClass( Lophoc.class )
         .addAnnotatedClass( Monhoc.class )
         .buildMetadata()
         .getSessionFactoryBuilder()
         .unwrap(OgmSessionFactoryBuilder.class)
OgmSession ogmSession = ogmSessionFactory.openSession();
```

```
// query returning an entity based on a simple predicate
select h from Hypothesis h where id = 16

// projection of the entity property
select id, description from Hypothesis h where id = 16

// projection of the embedded properties
select h.author.address.street from Hypothesis h where h.id = 16

// predicate comparing a property value and a literal
from Hypothesis h where h.position = '2'

// negation
from Hypothesis h where not h.id = '13'
from Hypothesis h where h.position <> 4

// conjunction
from Hypothesis h where h.position = 2 and not h.id = '13'

// named parameters
from Hypothesis h where h.description = :myParam
```

Using JP-QL

```
@Entity @Indexed
public class Hypothesis {

    @Id
    public String getId() { return id; }
    public void setId(String id) { this.id = id; }
    private String id;

    @Field(analyze=Analyze.NO)
    public String getDescription() { return description; }
    public void setDescription(String description) { this.description = description; }
    private String description; }
}

Query query = session
    .createQuery("from Hypothesis h where h.description = :desc")
    .setString("desc", "tomorrow it's going to rain");
```

```
// range query
from Hypothesis h where h.description BETWEEN :start and :end

// comparisons
from Hypothesis h where h.position < 3

// in
from Hypothesis h where h.position IN (2, 3, 4)

// like
from Hypothesis h where h.description LIKE '%dimensions%'

// comparison with null
from Hypothesis h where h.description IS null

// order by
from Hypothesis h where h.description IS NOT null ORDER BY id
from Helicopter h order by h.make desc, h.name
```

Using the native query language of your NoSQL

```
@Entity
@NameNativeQuery(
   name = "AthanasiaPoem",
   query = "{ $and: [ { name : 'Athanasia' }, { author : 'Oscar Wilde' } ] }",
   resultClass = Poem.class )
public class Poem {
   @Id
   private Long id;
   private String name;
   private String author;
   // getters, setters ...
}
```

9

with OgmSession

- Use OgmSession.createNativeQuery or Session.getNamedQuery.
- The former form lets you define the result set mapping programmatically. The latter is receiving the name of a predefined query already describing its result set mapping.

```
OgmSession session = (OgmSession)em.getDelegate();
//OgmSession ogmSession = em.unwrap(OgmSession.class);
```

11

with EntityManager

10

Using Hibernate Search (Apache Lucene)

- Hibernate Search offers a way to index Java objects into Lucene indexes and to execute full-text queries on them.
- Apache Lucene is a full-text indexing and query engine with excellent query performance. Feature wise, full-text means you can do much more than a simple equality match.

```
@Entity @Indexed
public class Hypothesis {

    @Id
    public String getId() { return id; }
    public void setId(String id) { this.id = id; }
    private String id;

    @Field(analyze=Analyze.YES)
    public String getDescription() { return description; }
    public void setDescription(String description) { this.description = description; }
    private String description;}
}
```

13

Using the Criteria API

Future Support

14

Default JPA mapping for an entity

```
@Entity
                                              // Overrides the collection name
public class News {
                                              @Table(name = "News_Collection")
                                              public class News {
    @Id
                                                  @Id
    private String id;
                                                  private String id;
    private String title;
                                                  // Overrides the field name
    // getters, setters ...
                                                  @Column(name = "headline")
                                                  private String title;
                                                   // getters, setters ...
// Stored in the Collection "News"
    "_id" : "1234-5678-0123-4567",
                                              // Stored in the Collection "News"
    "title": "On the merits of NoSQL",
                                                  "_id" : "1234-5678-0123-4567",
                                                   "headline": "On the merits of NoSQL",
    Default JPA mapping for an entity
                                          Rename field and collection using @Table and @Column 15
```

Define an identifier as a primitive type

```
@Entity
public class Bookmark {
    @Id
    private String id;
    private String title;
    // getters, setters ...
}

{
    "_id" : "bookmark_1"
    "title" : "Hibernate OGM documentation"
}
```

Define an identifier using @EmbeddedId

```
@Embeddable
public class NewsID implements Serializable {
    private String title;
    private String author;
    // getters, setters ...
}

@EmbeddedId
private NewsID newsId;
private String content;

// getters, setters ...
}
```

```
{
   "_id" : {
      "author" : "Guillaume",
      "title" : "How to use Hibernate OGM ?"
},
   "content" : "Simple, just like ORM but with a NoSQL database"
}
```

Identifier generation strategies

- You can assign id values yourself or let Hibernate OGM generate the value using the @GeneratedValue annotation.
- There are 4 different strategies:
 - IDENTITY (suggested)
 - 。 TABLE
 - SEQUENCE
 - 。 AUTO

Define an id as org.bson.types.ObjectId

- Generally, it is recommended though to work with MongoDB's object id data type.
- This will facilitate the integration with other applications expecting that common MongoDB id type. To do so, you have two options:
 - Define your id property as org.bson.types.ObjectId
 - Define your id property as String and annotate it with @Type(type="objectid")

```
@Entity
public class News {

   @Id
   private ObjectId id;
   private String title;
   // getters, setters ...
}

@Entity
public class News {

   @Id
   @Type(type = "objectid")
   private String id;

   private String title;
   // getters, setters ...
}
```

Define an id of type String as ObjectId

```
@Entity
public class News {
    @Id
    @GeneratedValue(strategy = GenerationType.IDENTITY)
    @Type(type = "objectid")
    private String id:
    private String title:
    // getters, setters ...
}

{
    "_id" : ObjectId("5425448830048b67064d40b1"),
    "title" : "Exciting News"
}

@Entity
public class News {
    @GeneratedValue(strategy = GenerationType.IDENTITY)
    private ObjectId id;
    private String title;
    // getters, setters ...
}

{
    "_id" : ObjectId("5425448830048b67064d40b1"),
    "title" : "Exciting News"
}
```

19 20

TABLE generation strategy

```
@Entity
public class GuitarPlayer {
    @Id
    @GeneratedValue(strategy = GenerationType.TABLE)
    private Long id;
    private String name;
    // getters, setters ...
}
GuitarPlayer collection hibernate_sequences collection
```

```
GuitarPlayer collection

{
    "_id" : NumberLong(1),
    "name" : "Buck Cherry"
}
```

```
{
    "_id" : "GuitarPlayer",
    "next_val" : 101
}
```

AUTO generation strategy

```
@Entity
public class DistributedRevisionControl {
    @Id
    @GeneratedValue(strategy = GenerationType.AUTO)
    private Long id;
    private String name;
    // getters, setters ...
}

DistributedRevisionControl collection
{ "_id" : NumberLong(1), "name" : "Git" }
```

{ "_id" : "hibernate_sequence", "next_val" : 2 }

23

SEQUENCE generation strategy

```
@Entity
public class Song {

    @Id
    @GeneratedValue(strategy = GenerationType.SEQUENCE)
    private Long id;

    private String title;

    // getters, setters ...
}
```

Embedded objects and collections (1)

```
@Entity
public class News {

    @Id
    private String id;
    private String title;

    @Embedded
    private NewsPaper paper;

    // getters, setters ...
}

@Embeddable
public class NewsPaper {
    private String name;
    private String owner;

    // getters, setters ...
```

```
{
    "_id" : "1234-5678-0123-4567",
    "title": "On the merits of NoSQL",
    "paper": {
        "name": "NoSQL journal of prophecies",
        "owner": "Delphy"
    }
}
```

Embedded objects and collections (2)

• @ElementCollection with primitive types

```
@Entity
public class AccountWithPhone {
    @Id
    private String id;
    @ElementCollection
    private List<String> mobileNumbers;
    // getters, setters ...
}
```

```
{
    "_id" : "john_account",
    "mobileNumbers" : [ "+1-222-555-0222", "+1-202-555-0333" ]
}
```

@ElementCollection with @OrderColumn

```
@Entity
public class GrandMother {
    private String id;
    @ElementCollection
    @OrderColumn( name = "birth_order" )
   private List<GrandChild> grandChildren = new ArrayList<GrandChild>()
   // getters, setters ...
                                                            "_id" : "e3e1ed4e-c685-4c3f-9a67-a5aeec6ff3ba"
                                                            "grandChildren"
@Embeddable
                                                                     "name" : "Luke",
public class GrandChild {
                                                                     "birth_order" : 0
    private String name;
                                                                     "name" : "Leia",
                                                                     "birthorder" : 1
   // getters, setters ...
                                                                                            27
```

• @ElementCollection with one attribute

```
@Entity
public class GrandMother {
    @Id
    private String id;
    @ElementCollection
    private List<GrandChild> grandChildren = new ArrayList<GrandChild>();
    // getters, setters ...
}

@Embeddable
public class GrandChild {
    private String name;
    // getters, setters ...
}

### Ind It is a setter in the setting name in the setting name;

### Ind It is a setting name;

### Ind
```

@ElementCollection with Map of @Embeddable

```
@Entity
public class ForumUser {
    private String name;
    @ElementCollection
    private Map<String, JiraIssue> issues = new HashMap<>();
                                                               " id" : "Jane Doe",
    // getters, setters ...
                                                                       "issueWithNull" : {
@Embeddable
                                                                       "issue2" : {
    "number" : 2000,
public class JiraIssue {
                                                                          "project" : "OGM"
    private Integer number;
                                                                       "issue1" : {
    private String project;
                                                                          "number" : 1253,
                                                                          "project" : "HSEARCH"
    // getters, setters ...
                                                                                        28
```

Associations

- Hibernate OGM MongoDB proposes three strategies to store navigation information for associations. The three possible strategies are:
 - 。 IN_ENTITY (default)
 - ASSOCIATION_DOCUMENT, using a global collection for all associations
 - COLLECTION_PER_ASSOCIATION, using a dedicated collection for each association
- In Entity strategy
 - 。 *-to-one associations
 - 。 *-to-many associations

29

31

Unidirectional one-to-one with @JoinColumn

```
@Entity
public class Vehicule {
    @Id
    private String id;
    private String brand;

    // getters, setters ...
}

{
    "_id" : "V_01",
    "brand" : "Mercedes"
```

```
@Entity
public class Wheel {
    @Id
    private String id;
    private double diameter;
    @OneToOne
    @JoinColumn( name = "part_of" )
    private Vehicule vehicule;
    // getters, setters...
}

{
    "_id" : "W001",
    "diameter" : 0,
```

"part_of" : "V_01"

```
To-one associations
```

```
@Entity
public class Vehicule {
    @Id
    private String id;
    private String brand;

    // getters, setters ...
}

@Entity
public class Wheel {
    @Id
    private String id;
    private String id;
    private double diameter;
    @OneToOne
    private Vehicule vehicule;
    // getters, setters ...
}
```

Unidirectional one-to-one

```
{
    "_id" : "V_01",
    "brand" : "Mercedes"
}

{
    "_id" : "W001",
    "diameter" : 0,
```

"vehicule_id" : "V_01"

30

Unidirectional one-to-one with @MapsId and @PrimaryKeyJoinColumn

```
@Entity
public class Vehicule {
    @Id
    private String id;
    private String brand;
    // getters, setters ...
}
```

```
{
    "_id" : "V_01",
    "brand" : "Mercedes"
}
```

```
@Entity
public class Wheel {

    @Id
    private String id;
    private double diameter;

    @OneToOne
    @PrimaryKeyJoinColumn
@MapsId
    private Vehicule vehicule;

    // getters, setters ...
}
```

"_id" : "V_01", "diameter" : 0,

Bidirectional one-to-one

```
@Entity
public class Husband {
   @Td
   private String id;
   private String name;
   @0neTo0ne
   private Wife wife;
   // getters, setters ...
```

```
" id" : "alex",
"name" : "Alex"
"wife" : "bea"
```

```
@Entity
public class Wife {
    private String id;
    private String name;
    @OneToOne
   private Husband husband;
    // getters, setters ...
```

```
" id" : "bea",
"name" : "Bea",
"husband" : "alex"
```

33

35

Bidirectional many-to-one

```
@Entity
                                                           @Entity
public class SalesForce {
                                                           public class SalesGuy {
                                                               private String id;
                                                               private String name;
   private String id;
   private String corporation;
                                                               @ManvToOne
    @OneToMany(mappedBy = "salesForce")
                                                               private SalesForce salesForce;
   private Set<SalesGuy> salesGuys = new HashSet<SalesGuy>();
                                                                // getters, setters ...
    // getters, setters ...
```

```
"_id" : "red_hat",
"corporation" : "Red Hat",
"salesGuys" : [ "eric", "simon"
```

```
"_id" : "eric",
"name" : "Eric"
"salesForce_id" : "red_hat"
"_id" : "simon",
"name" : "Simon".
"salesForce_id" : "red_hat"
```

Unidirectional many-to-one

```
@Entity
public class JavaUserGroup {
   private String jugId;
   private String name;
   // getters, setters ...
```

"_id" : "summer_camp",

```
private String id;
                private String name;
                @ManyToOne
                private JavaUserGroup memberOf
                // getters, setters ...
"_id" : "jerome",
"name" : "Jerome"
```

public class Member {

@Entity

```
"name" : "JUG Summer Camp'
                                 "memberOf_jugId" : "summer_camp"
                                 "_id" : "emmanuel",
                                 "name" : "Emmanuel Bernard"
                                 "memberOf_jugId" : "summer_camp"
```

34

Bidirectional many-to-one between entities with embedded ids

```
@Entity
public class Game {
    @EmbeddedId
   private GameId id;
    private String name;
    @ManyToOne
    private Court playedOn;
   // getters, setters ...
public class GameId implements Serializable
   private String category;
